

Farm-O-San Recover

Next-generation oral rehydration
drench for off-feed cows

Getting cows back on their feet

A healthy cow spends 7 to 8 hours a day ruminating, and the first sign of disease is often a reduction in rumination time. Most diseases result in reduced appetites and water consumption, leaving cows dehydrated and at risk of further complications. Early intervention with oral rehydration therapy is a powerful tool to reduce recovery time and stimulate feed and water intake to maintain production levels.

Recover has been carefully formulated to give sick, off-feed and dehydrated cows the best support. **Recover** contains high levels of:

- Calcium Propionate:** provides a slow-release form of calcium and also propionate, a precursor of glucose, to improve energy status and reduce the risk of ketosis.
- Magnesium Sulphate:** highly soluble form of magnesium to help calcium mobilisation and reduce risk of hypomagnesaemia.
- Potassium Chloride:** source of potassium to reduce risk of hypokalemia.
- Yela Prosecure:** hydrolysed yeast which provides highly digestible protein and amino acids to support rumen microbes.
- Levucell:** live yeast to buffer the pH of the rumen and support rumen environment.
- Vivalto:** blend of five protected B vitamins to support metabolic recovery.

For fast rehydration, and a broad range of rumen and metabolic support:

- Mix 1 sachet/910g of Recover with 20 L of warm water (20-35°C)
- Administer to cow using a stomach pump
- Max feed rate of 1 sachet every 12 hours
